

WA Suite — Custom Site Integration Guide

Send WhatsApp messages from any website (React, Vue, Next.js, plain PHP, etc.) using a Custom Site License.

1. Generate a Custom Site License

Log in to your WA Suite dashboard → Custom Site Integration → select your brand → click **Generate WAN-... key**. Copy the key (starts with WAN-). One license = one site. Your subscription package decides how many active licenses you can have.

2. Add a server-side proxy

Your website's backend holds the license key and forwards calls to our API. **Never put the license key in browser code** — anyone could copy it from DevTools.

```
// e.g. /api/send-wa (Node / Next.js / Vite SSR / Cloudflare Worker)
export async function POST(req) {
  const { recipient, message, customer_name } = await req.json();
  const r = await fetch("https://wasuite.hostercamp.com/api/public/plugin/send", {
    method: "POST",
    headers: { "Content-Type": "application/json" },
    body: JSON.stringify({
      license_key: process.env.WA_LICENSE_KEY, // server-side only
      recipient, message, customer_name,
    }),
  });
  return new Response(await r.text(), { status: r.status });
}
```

3. Call it from your frontend

```
await fetch("/api/send-wa", {
  method: "POST",
  headers: { "Content-Type": "application/json" },
  body: JSON.stringify({
    recipient: "+8801XXXXXXXXX",
    message: `Hi ${name}, your order #${id} is confirmed.`,
    customer_name: name,
  }),
});
```

4. One-time setup (run from your server)

Register your site so we record the domain:

```
curl -X POST https://wasuite.hostercamp.com/api/public/plugin/activate \
  -H "Content-Type: application/json" \
  -d '{"license_key": "WAN-XXXX-XXXX-XXXX-XXXX", "site_url": "https://yoursite.com"}'
```

Pick the WhatsApp device this license sends through:

```
curl "https://wasuite.hostercamp.com/api/public/plugin/devices?license_key=WAN-XXXX-XXXX-XXXX-XXXX"
```

```
curl -X POST https://wasuite.hostercamp.com/api/public/plugin/select-device \
  -H "Content-Type: application/json" \
  -d '{"license_key": "WAN-XXXX-XXXX-XXXX-XXXX", "device_id": "<uuid-from-above>"}'
```

REST Endpoint Reference

POST /api/public/plugin/activate — Register site_url for the license

GET /api/public/plugin/devices — List devices the license can use

POST /api/public/plugin/select-device — Choose the device for this license

POST /api/public/plugin/send — Send a WhatsApp message

POST /api/public/plugin/heartbeat – Optional ping to update last-seen

GET /api/public/plugin/stats – 7-day send stats for the license

Rate limits & safety

Built-in protections (per brand): 20 sends/minute, 400 sends/hour, 60s cooldown per recipient, 10-minute duplicate-message suppression, blocked-number list, and human-like jitter. If you exceed a limit the API returns HTTP 429 with a *retry_after* hint.
